Example Applications

HV-F31 and HV-F22 are designed for a wide range of applications.

■ Printing Check

Detection of uneven printing

■ Fruit Check

Check on fruit damage and ripening

■ Car Body Coating

Check on uneven coating and scratches

■ Biological Microscope

Observation of cells

Merits of 3-CCD Camera

Color Detection (optimum for check on uneven printing and fruits)

Subtle color differences are detectable by processing (emphasis or subtraction) of a specific color using 6-color independent masking.

● Example of improved detection accuracy on apple ripening level

Comparison after subtraction of a red component and emphasis of a yellow component

(Note) This camera is not used for output of the above numeral (resolution in 8bit). It is output of a processed image.

● Because arithmetic operation is performed inside the camera, it will not apply a load to the CPU of equipment, so high-speed image processing is ensured.

Auto Shading

Color shading (uneven color) due to lens and lighting can be automatically corrected.

6color Independent Masking

Each color of R,G,B,Ye,Mg and Cy can be represented and changed as an independent numeric value.

Colors are freely changeable and the following are available.

- Detection of a specific color
 - Natural color reproduction
 - Red alone changed

IEEE1394

- Features
 - Direct PC connection without using a frame grabber board
 - Small-diameter cable
 - Multiple cameras connectable by use of hub
- Specifications
 - Compatible OHCI, 400Mbps
 - Non-compression
 - Conforming with IIDC1.3

Transmission Format

The HV-F31F/F22F cameras allow transmission of an image with its size changed by remote operation.

Application

Various camera functions, such as a Shutter, Gamma, Masking, etc. are available for adjustment through the easy to use GUI software which is included with the camera.

Frame On-demand function

An image can be acquired at a desired timing by external input of a trigger signal.

- One-trigger mode

When a single trigger pulse is input, exposure will start at the rising edge of the pulse and will end at the falling edge. Then, V.SYNC will be reset immediately followed by output of the image. Pulse width corresponds to the exposure time
