

www.axxonnext.com

Axxon Next is best-in-class, new-generation Video Management Software that is based on open standards to offer a truly open platform. Axxon Next's reliability, performance, and convenience are unmatched on the market. Experience unprecedented flexibility and freedom of configuration: unlimited number of video servers, cameras, workstations and mobile client devices, and approximately 1,000 models of IP cameras are all supported. Thanks to the program's application programming interface (API), Axxon Next allows easily integrating third-party hardware to extend your video system's functionality yet further. The advanced ergonomic interface makes all functions intuitively easy to use and find. A transparent customer-oriented pricing policy means that you can take advantage of the program's full functionality, no matter the size of your system. Axxon Next is available in a free version with support for 16 connected cameras and an included license for video and audio detection tools.

## AXXON NEXT HIGHLIGHTS

- Unlimited number of cameras, servers and remote clients
- Web and mobile access support
- Support for approximately 1,000 IP camera models
- 3D Interactive Map for instant camera pinpoint
- Advanced video analytics
- Unique tools for fast video footage retrieval
- Flat pricing—easy to budget and save
- Zero maintenance fees

## PRODUCT FEATURES

### PERFORMANCE

The file system is a common bottleneck in VMS. Fragmentation of video footage files builds up over time, causing slow hard drive access that brings even the most advanced processors to a halt. This is why a specialized file system, called SolidStore, has been devised for Axxon Next to tackle fragmentation and boost read/write speeds to near the physical limits of the hard disk mechanism. Another benefit: the SolidStore file system reduces HDD wear, thereby extending hardware lifespan.

### RELIABILITY

Security software just has to work, day in and day out. Axxon Next's robust micro module architecture allows running video surveillance functions as independent processes that are managed by a dispatcher module. If a process fails, the dispatcher simply restarts it—other processes keep running and the video surveillance system operates like normal. Each process is controlled by a separate micro module. Each micro module undergoes automated code testing during development, which significantly reduces the likelihood of errors in program code.

## EFFICIENCY

Poring over video archives can take up most of your time as a VMS user. Axxon Next, in addition to its user-friendly archive viewer, offers two features that make data search far more convenient. MomentQuest2 forensic search helps to quickly spot video segments by various search criteria such as crossing a virtual line in a user-defined direction or motion in the selected zone of a frame. Time Compressor displays all objects that had been moving in the frame within a set time period. Just click on an object of interest and instantly go to view the corresponding video.

## USABILITY

Axxon Next is a user-friendly, intuitive system that lets security personnel get started quickly and easily, without needing to learn complicated workflows and procedures. The ergonomic interface ensures excellent usability and makes it easy to access the system's full functionality right away. Axxon Next includes the Interactive 3D Map, which superimposes camera locations on a site map and displays camera views in the same window. This handy viewing mode allows operators to monitor situations without spending time to switch between windows. Operators can instantly pinpoint where a selected camera is located on the map and identify the corresponding location of interest.

## FUNCTIONALITY

AxxonSoft believes that video analytics are a must-have for any modern VMS. That's why Axxon Next features a range of powerful video detection tools absolutely free: motion detection, abandoned object detection, camera tampering and failure detection tools, and six scene analysis tools. Axxon Next also supports video analysis capabilities embedded into IP cameras.

## AVAILABILITY

State-of-the-art video management systems are critical for guaranteeing the security of sites big or small. That's why we don't release "crippled" versions of Axxon Next with limited features. We practice flat pricing: we offer the same price for a video channel, no matter how many there are. All functions are just as accessible and just as effective whether installed on a system of one camera or infinite cameras. Axxon Next means no hidden expenses and no maintenance fees. We provide free software updates and free technical support for all of our users and partners. This means you can create modern, effective video surveillance systems that are easy to budget.

*AxxonSoft's flexible, client-oriented pricing policy allows creating systems with greater functionality and more advanced cameras than any other VMS software.*
