Exhibitions and information strikingly presented – transparent LCD monitors from eyevis

HIGH TRANSPARENCY

OPTIONAL WITH TOUCH-SYSTEM

1680 × 1050 px / 1366 × 768 px

22"/46"

The brand-new transparent LCD displays from eyevis are an additional innovation in the eyevis LCD product portfolio. Their development is based upon a simple out definitive question: how effect would it be to present product information or advertising simultaneously with, or superimposed upon, the advertised product?

Both of the transparent monitors, EYE-LCD-2200-TP and EYE-LCD-4600-TP, provide just this possibility.

The revolution represented by this completely new display type is its transparency. It creates the ideal infotainment medium for the use of the monitor in show windows, at points of sale, in display cases, at trade fair stands and in many additional areas in which the goal is to stimulate the attention of the observers, awaken their interest, and, quite simply, stop them in their tracks. For with these monitors and their extremely quick reaction times, the information, images, presentations, films and graphics are, in a unique manner, united with the real object in the background.

Additional applications are museum and gallery rooms, sales and information areas as well as trade fairs and events. And the integration into touch-tables or as integrated component of interior decoration – for example as an installation in doors – is also conceivable.

The delivery scope of the device includes the panel itself and the proper LCD driver. The necessary external backlight can, for example, be integrated into a display case.

The displays are available in screen diagonals of 22 and 46 inches. The 22-inch display has a resolution of 1680 × 1050 px. The 46-inch display has a resolution of 1366 × 768 px. Both versions are available only in color.

The monitors can spread the wings of their extraordinary effects both in portrait and landscape format applications.
